PROTEGRITY

Protegrity's Database Protector for MS SQL Server

Duration: 4 hours (half-day)
Audience: Developers, database administrators, system administrators, and solution architects
Prerequisite: Protegrity's Data Protection Fundamentals course
Certificate of Completion: Yes

Description:
Install and configure Protegrity's Database Protector for MS SQL Server. The Protegrity MS SQL Server Database Protector is a software-based solution for handling column-level data protection. This column-level data protection is tightly integrated with the database, which results in better performance due to minimized overhead.

The Protegrity MS SQL Server Protector will be combined with the Enterprise Security Administrator (ESA).

This training course is a thorough examination of column-level data protection on an MS SQL Server database. It includes demos, knowledge checks, and hands-on labs.

Agenda:
- Overview of Protegrity's Database Protector
- Database Protector: protection at rest
- Database Protector Cycle: Database Protector
- Installation
- Database Protectors: UDFs
- Scripts for protect and unprotect
- Protect and unprotection patterns
- PEP Server examples
- Best practices
- Troubleshooting
